

Acute Asthma / Wheeze Pathway (not for Bronchiolitis)

Clinical Assessment / Management Tool for Children & Young People Older than 1 year old with Acute Wheeze

Management – Primary Care and Community Setting

Patient >1 yr with wheeze presents:

*avoid oral steroids in episodic wheezers (wheezers only with colds). Oral steroids play a role in treating acute exacerbations in multiple trigger wheezers (asthma, eczema, allergies)

Consider other diagnoses:

- Cough without a wheeze
- foreign body
- croup
- bronchiolitis

| ASSESSMENT | Low Risk MILD - GREEN | Intermediate Risk MODERATE - AMBER | High Risk SEVERE - RED | IMMEDIATELY LIFE-THREATENING - PURPLE | Normal Values |
|----------------------|---|---|--|--|---|
| Behaviour | Alert; No increased work of breathing | Alert; Some increased work of breathing | May be agitated; Unable to talk freely or feed | Can only speak in single words; Confusion or drowsy; Coma | Respiratory Rate at rest [b/min] 1-2yrs 25-35 >2-5 yrs 25-30 >5-12 yrs 20-25 >12 yrs 15-20 |
| O2 Sat in air | ≥ 95%; Pink | ≥ 92%; Pink | < 92%; Pale | < 92%; Cyanosis; Grey | |
| Heart Rate | Normal | Normal | Under 5yr >140/min Over 5 yr >125/min | Under 5yr >140/min Over 5 yr >125/min Maybe bradycardic | Heart Rate [bpm] 1-2yrs 100-150 >2-5 yrs 95-140 >5-12 yrs 80-125 >12 yrs 60-100 |
| Respiratory | Normal Respiratory rate Normal Respiratory effort Peak Flow □ (only for children > 6yrs with established technique) PEFR >75% l/min best/predicted | Under 5 yr <40 breaths/min Over 5 yr <30 breaths/min Mild Respiratory distress: mild recession and some accessory muscle use PEFR 50-75% l/min best/predicted | Under 5 yr >40 breaths/min Over 5 yr >30 breaths/min Moderate Respiratory distress: moderate recession & clear accessory muscle use PEFR <50% l/min best/predicted | Severe Respiratory distress Poor respiratory effort: Silent chest Marked use of accessory muscles and recession PEFR <33% l/min best/predicted or too breathless to do PEFR | |

GREEN ACTION

Salbutamol 2-4 'puffs' via inhaler & spacer (check inhaler technique) - use higher dose if Tx started by parent as per asthma action plan.

Advise – Person prescribing ensure it is given properly

- Continue Salbutamol 4 hourly as per instructions on safety netting document.

Provide:

- Appropriate and clear guidance

should be given to the patient/carer in the form of an [Acute exacerbation of Asthma/Wheeze](#) safety netting sheet.

- If exacerbation of asthma, ensure they have a personal asthma plan.
- Confirm they are comfortable with

the decisions / advice given and then think "Safeguarding" before sending home.
• Consider referral to acute paediatric community nursing team if available

AMBER ACTION

Salbutamol (check inhaler technique) x 10 'puffs' via inhaler and spacer
• Reassess after 20 – 30 minutes
• Oral Prednisolone within 1 hour for 3 days if known asthmatic

<2 years - avoid steroids if episodic wheeze. 10mg/day if multiple trigger wheezer.*

2-5 years 20 mg/day
Over 5 years 30-40 mg/day

IMPROVEMENT?
Lower threshold for referral to hospital if concerns about social circumstances/ability to cope at home or if previous severe/life threatening asthma attack

Follow Amber Action if:

- Relief not lasting 4 hours
- Symptoms worsen or treatment is becoming less effective

URGENT ACTION

Refer immediately to emergency care by 999

Alert Paediatrician

- Oxygen to maintain O₂ Sat > 94%, using paediatric nasal cannula if available
- Salbutamol 100 mcg x 10 'puffs' via inhaler & spacer

OR Salbutamol 2.5 – 5 mg Nebulised

- Repeat every 20 minutes whilst awaiting transfer
- If not responding add Ipratropium 20mcg/dose - 8 puffs or 250 micrograms/dose nebulised mixed with the salbutamol.
- Oral Prednisolone start immediately: 2-5 years 20 mg/day Over 5 years 30-40 mg/day
- Paramedics to give nebulised Salbutamol, driven by O₂, according to protocol

- Stabilise child for transfer and stay with child whilst waiting
- Send relevant documentation

ACTION IF LIFE THREATENING

Repeat Salbutamol 2.5 - 5 mg via Oxygen-driven nebuliser whilst arranging immediate hospital admission - 999

Hospital Emergency Department / Paediatric Unit

HOME

FOLLOWING ANY ACUTE EPISODE, THINK:

1. Asthma / wheeze education and inhaler technique
2. Written Asthma/Wheeze action plan
3. Early review by GP / Practice Nurse –

First Draft Version: Oct 2011 • Final Version: May 2016 • Review Date: May 2018

This guidance has been reviewed and adapted by healthcare professionals across the Black Country

This document was arrived at after careful consideration of the evidence available including but not exclusively NICE, SIGN, EBM data and NHS evidence, as applicable. Healthcare professionals are expected to take it fully into account when exercising their clinical judgement. The guidance does not, however, override the individual responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient in consultation with the patient and / or carer.
